<i>CLIENT/PROJECT:</i>	BE RE, LLC Rocky Maple Solar
<i>SUBJECT/TITLE:</i>	Pre-Development Conditions Hydrology
<i>OBJECTIVE OF CALCULATION:</i>	<ul style="list-style-type: none"> To determine the pre-development peak rates of runoff and stormwater volumes from the site for the 1, 2, 10, 25, 50, & 100-year storm events at the design points.
<i>CALCULATION METHOD(S):</i>	<ul style="list-style-type: none"> Runoff curve numbers (CN), time-of-concentration (Tc), and runoff rates were calculated based on TR-55 methodology. AutoCAD 2019 computer program was utilized for digitizing ground cover areas. Peak runoff rates and volumes were computed using HydroCAD version 10.00.
<i>ASSUMPTIONS:</i>	<ul style="list-style-type: none"> The ground cover types were determined using aerial imagery. Hydrologic soil groups based on United States Department of Agriculture, NRCS Soil Survey map information. Stormwater runoff from offsite tributary areas was not included in the calculations. Wetlands were excluded from this calculation.
<i>SOURCES OF DATA/EQUATIONS:</i>	<ul style="list-style-type: none"> Pre-Development Conditions Hydrologic Areas Map prepared by Beals and Thomas, Inc. File No. 320300P004C-001. NRCS Soil Survey for Plymouth County, downloaded from Web Soil Survey on 06/03/2020. TR-55 urban Hydrology for Small Watersheds, SCS, 1986. Massachusetts DEP Stormwater Management Handbook, February 2008.

CONCLUSIONS:
Peak Runoff Rates (CFS):

Storm Event	DP-1
1-Year	10.92
2-Year	26.67
10-Year	86.83
25-Year	143.12
50-Year	199.56
100-Year	270.44

Total Runoff Volumes (AF):

Storm Event	DP-1
1-Year	1.55
2-Year	2.66
10-Year	6.81
25-Year	10.71
50-Year	14.66
100-Year	19.67

2	N. Bautz	04/01/2021	N. Santangelo	04/02/2021	E. Las	04/07/2021

CONCLUSIONS:
Peak Runoff Rates (CFS):

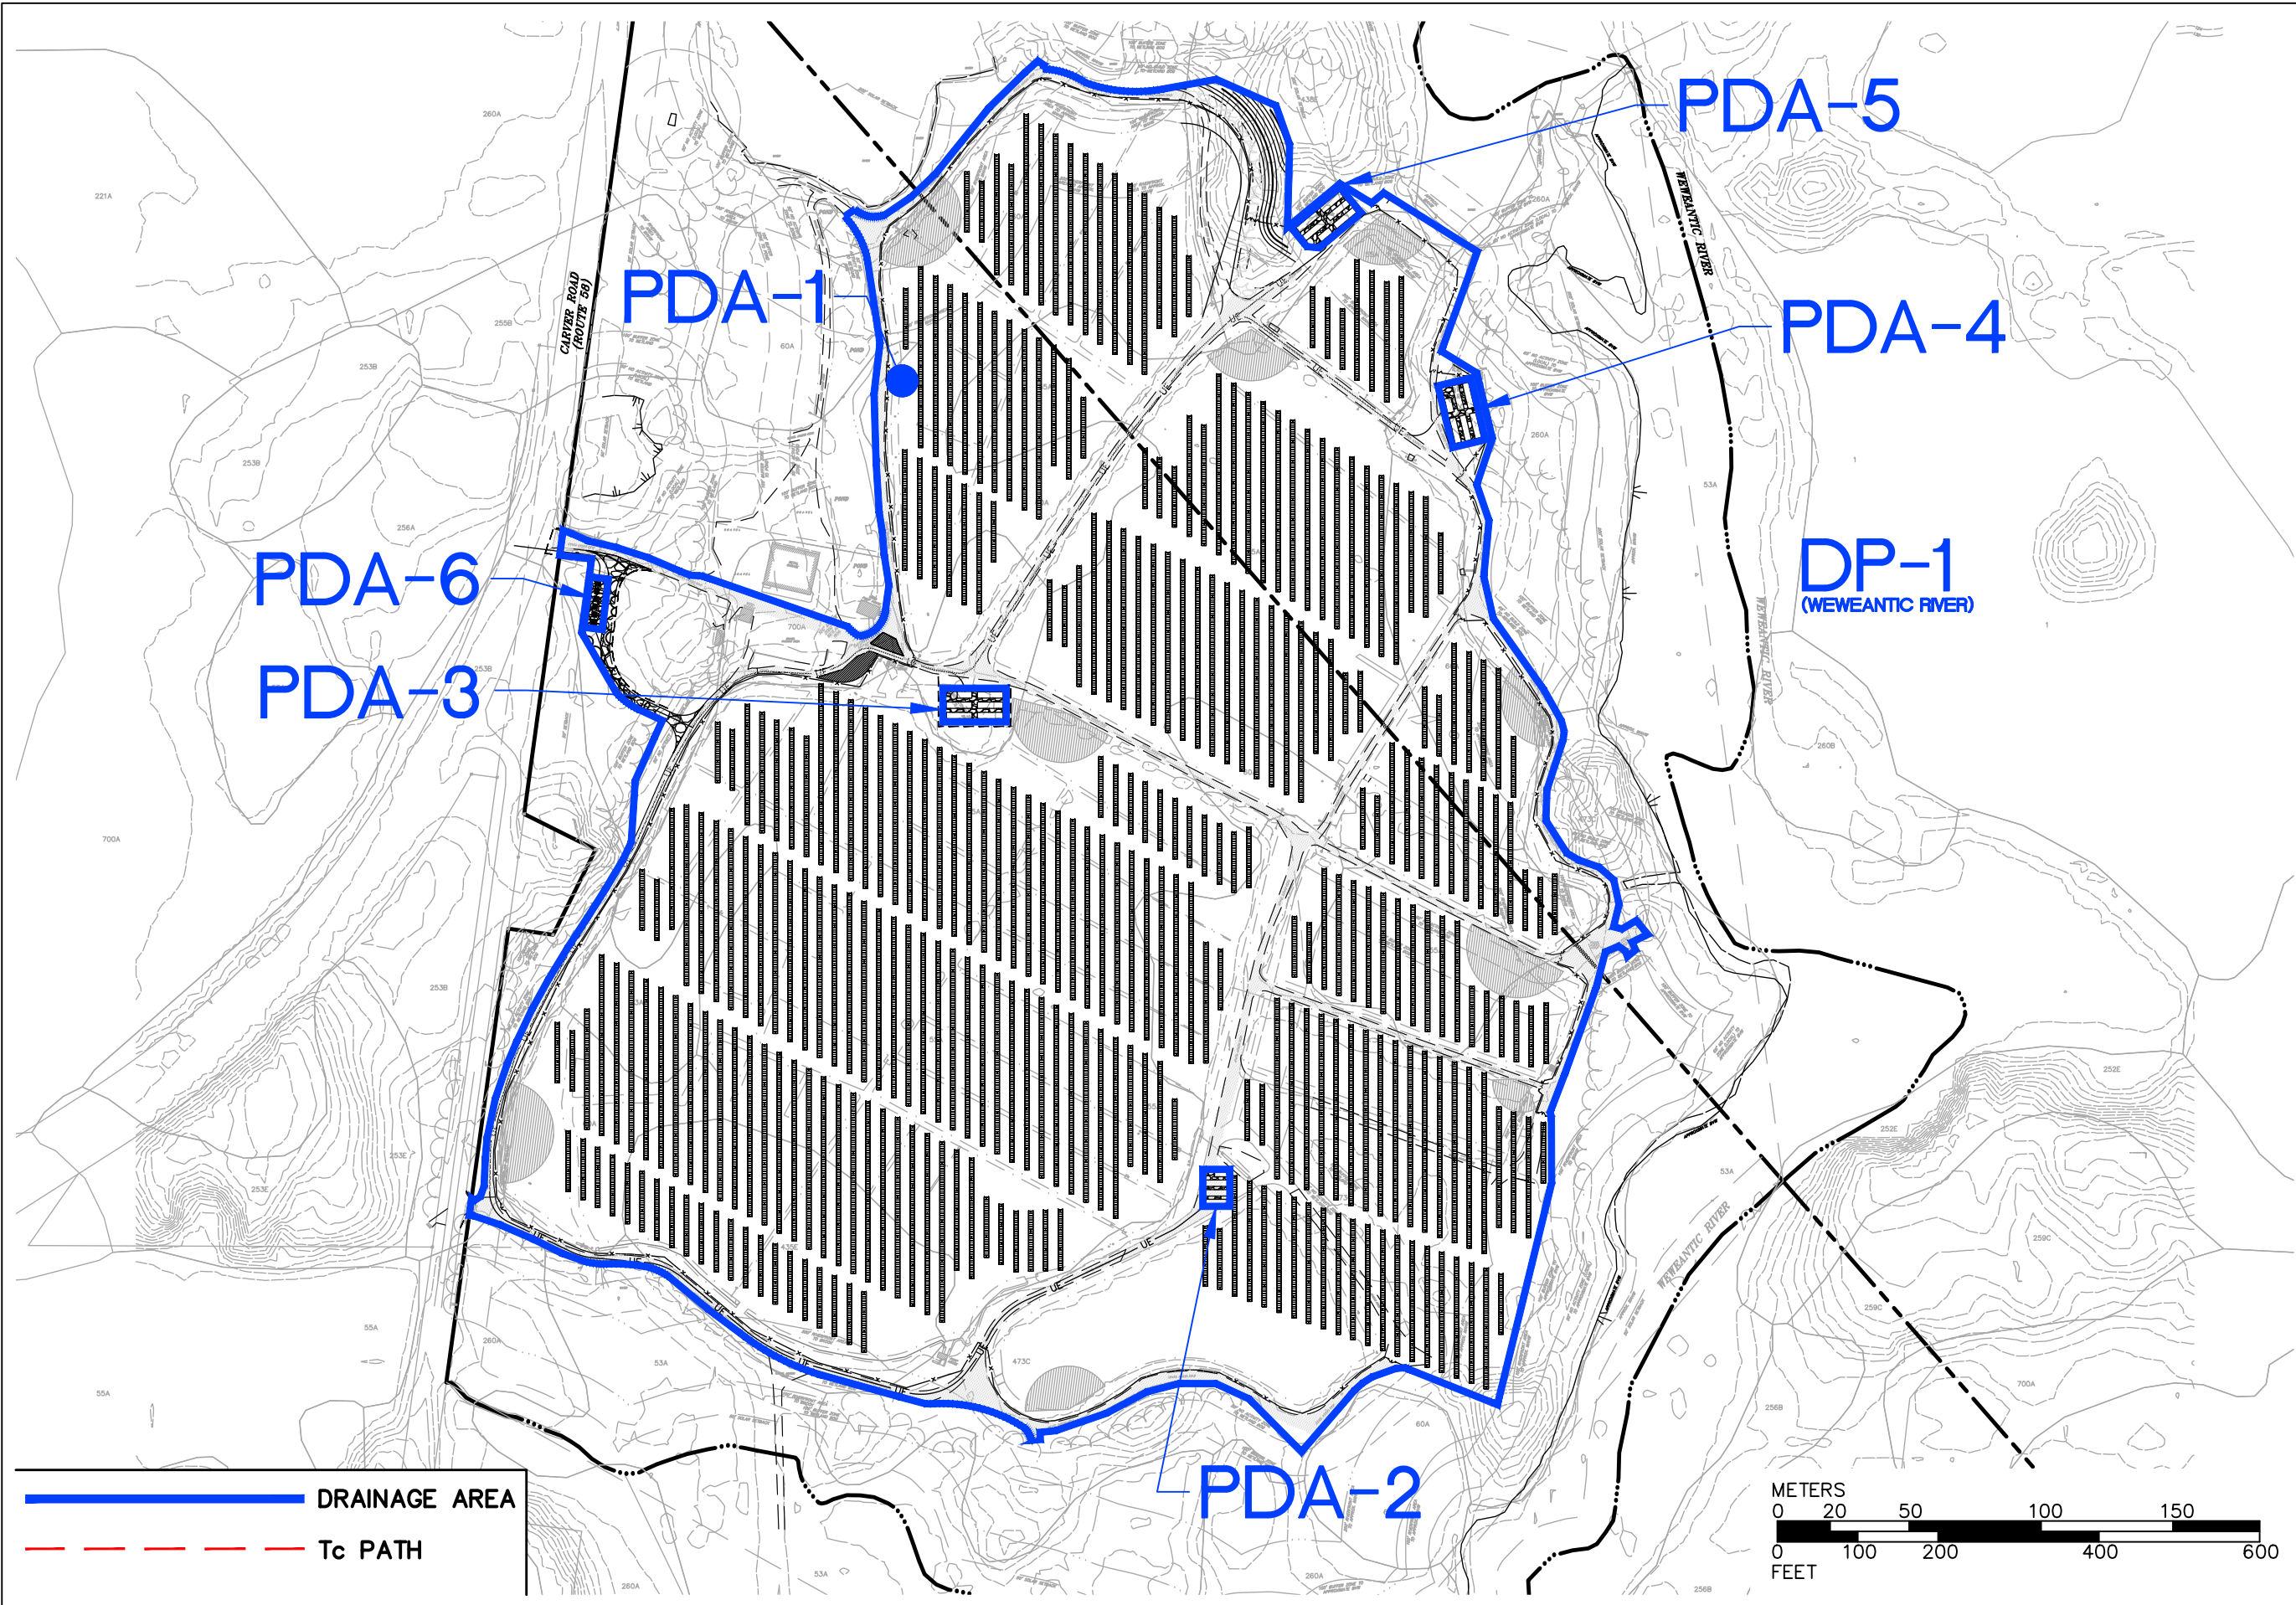

Storm Event	DP-1
1-Year	10.84
2-Year	26.46
10-Year	86.14
25-Year	141.99
50-Year	197.98
100-Year	268.29

Total Runoff Volumes (AF):

Storm Event	DP-1
1-Year	1.54
2-Year	2.64
10-Year	6.75
25-Year	10.62
50-Year	14.54
100-Year	19.51

Conclusion: Overall runoff rates and volumes from the project area will be less than existing conditions in accordance with Standard 2 of the MassDEP Stormwater Management Regulations and local bylaws.

 www.bealsandthomas.com
 Regional Office: Plymouth, MA

JOB NO./LOCATION:	3203.00 Carver & Wareham, MA
CLIENT/PROJECT:	BE RE, LLC Rocky Maple Solar
SUBJECT/TITLE:	Groundwater Mounding Calculations for Infiltration Bed 1
OBJECTIVE OF CALCULATION:	<ul style="list-style-type: none"> To determine the maximum groundwater mounding height beneath Infiltration Bed 1.
CALCULATION METHOD(S):	<ul style="list-style-type: none"> Estimated maximum groundwater mounding height calculated using Hantush equation.
ASSUMPTIONS:	<ul style="list-style-type: none"> Vertical hydraulic conductivity [R] (unsaturated zone) is equal to the infiltration rate of the proposed basin = 2.41 in/hr = 4.82 ft/day. Horizontal hydraulic conductivity [K] (saturated zone) is 200 ft/day based on data provided in USGS Report 86-4053A for mixed sand and gravel. Specific yield [Sy] is 0.26 based on data provided in GSWWS Paper 1662-D for Medium Sand Estimated saturated thickness [hi(0)] is 10.00 ft based upon observed seasonal high groundwater and additional field observations during subsurface explorations. ½ the length of basin (in x direction) [x] = 29 ft ½ the width of basin (in y direction) [y] = 21 ft Infiltration Basin-1 takes approximately 1.956 hours (t=0.082 days) to dewater.
SOURCES OF DATA/EQUATIONS:	<ul style="list-style-type: none"> Hantush equation spreadsheet published by the USGS. Page 2 of USGS Report 86-4053A, <i>Yield and Quality of Ground Water from Stratified-Drift Aquifers, Taunton River Basin, Massachusetts: Executive Summary</i>, 1989. Page D1 of GWSWS Paper 1662-D, <i>Specific Yield – Compilation of Specific Yields for Various Materials</i>, 1967. <i>Massachusetts Stormwater Handbook</i>, 2008
CONCLUSIONS:	The mounding analysis indicates that the groundwater elevation would rise approximately <u>0.784-feet</u> to infiltrate the required volume. Therefore, it can be concluded that the rise in groundwater elevation will not prohibit the basin from dewatering within 72 hours.

This spreadsheet will calculate the height of a groundwater mound beneath a stormwater infiltration basin. More information can be found in the U.S. Geological Survey Scientific Investigations Report 2010-5102 "Simulation of groundwater mounding beneath hypothetical stormwater infiltration basins".

The user must specify infiltration rate (R), specific yield (Sy), horizontal hydraulic conductivity (Kh), basin dimensions (x, y), duration of infiltration period (t), and the initial thickness of the saturated zone (hi(0), height of the water table if the bottom of the aquifer is the datum). For a square basin the half width equals the half length (x = y). For a rectangular basin, if the user wants the water-table changes perpendicular to the long side, specify x as the short dimension and y as the long dimension. Conversely, if the user wants the values perpendicular to the short side, specify y as the short dimension, x as the long dimension. All distances are from the center of the basin. Users can change the distances from the center of the basin at which water-table aquifer thickness are calculated.

Cells highlighted in yellow are values that can be changed by the user. Cells highlighted in red are output values based on user-specified inputs. **The user MUST click the blue "Re-Calculate Now" button each time ANY of the user-specified inputs are changed** otherwise necessary iterations to converge on the correct solution will not be done and values shown will be incorrect. Use consistent units for all input values (for example, feet and days)

This spreadsheet solving the Hantush (1967) equation for ground-water mounding beneath an infiltration basin is made available to the general public as a convenience for those wishing to replicate values documented in the USGS Scientific Investigations Report 2010-5102 "Groundwater mounding beneath hypothetical stormwater infiltration basins" or to calculate values based on user-specified site conditions. Any changes made to the spreadsheet (other than values identified as user-specified) after transmission from the USGS could have unintended, undesirable consequences. These consequences could include, but may not be limited to: erroneous output, numerical instabilities, and violations of underlying assumptions that are inherent in results presented in the accompanying USGS published report. The USGS assumes no responsibility for the consequences of any changes made to the spreadsheet. If changes are made to the spreadsheet, the user is responsible for documenting the changes and justifying the results and conclusions.

SUBJECT/TITLE:	Groundwater Mounding Calculations for Infiltration Bed 5
OBJECTIVE OF CALCULATION:	<ul style="list-style-type: none"> To determine the maximum groundwater mounding height beneath Infiltration Bed 5.
CALCULATION METHOD(S):	<ul style="list-style-type: none"> Estimated maximum groundwater mounding height calculated using Hantush equation.
ASSUMPTIONS:	<ul style="list-style-type: none"> Vertical hydraulic conductivity [R] (unsaturated zone) is equal to the infiltration rate of the proposed basin = 2.41 in/hr = 4.82 ft/day. Horizontal hydraulic conductivity [K] (saturated zone) is 200 ft/day based on data provided in USGS Report 86-4053A for mixed sand and gravel. Specific yield [Sy] is 0.26 based on data provided in GSWWS Paper 1662-D for Medium Sand Estimated saturated thickness [hi(0)] is 10.00 ft based upon observed seasonal high groundwater and additional field observations during subsurface explorations. ½ the length of basin (in x direction) [x] = 39.5 ft ½ the width of basin (in y direction) [y] = 14.5 ft Infiltration Basin-5 takes approximately 1.973 hours (t=0.082 days) to dewater.
SOURCES OF DATA/EQUATIONS:	<ul style="list-style-type: none"> Hantush equation spreadsheet published by the USGS. Page 2 of USGS Report 86-4053A, <i>Yield and Quality of Ground Water from Stratified-Drift Aquifers, Taunton River Basin, Massachusetts: Executive Summary</i>, 1989. Page D1 of GWSWS Paper 1662-D, <i>Specific Yield – Compilation of Specific Yields for Various Materials</i>, 1967. <i>Massachusetts Stormwater Handbook</i>, 2008
CONCLUSIONS:	The mounding analysis indicates that the groundwater elevation would rise approximately <u>0.685-feet</u> to infiltrate the required volume. Therefore, it can be concluded that the rise in groundwater elevation will not prohibit the basin from dewatering within 72 hours.

**BEALS + THOMAS**

This spreadsheet will calculate the height of a groundwater mound beneath a stormwater infiltration basin. More information can be found in the U.S. Geological Survey Scientific Investigations Report 2010-5102 "Simulation of groundwater mounding beneath hypothetical stormwater infiltration basins".

The user must specify infiltration rate (R), specific yield (Sy), horizontal hydraulic conductivity (Kh), basin dimensions (x, y), duration of infiltration period (t), and the initial thickness of the saturated zone (hi(0), height of the water table if the bottom of the aquifer is the datum). For a square basin the half width equals the half length (x = y). For a rectangular basin, if the user wants the water-table changes perpendicular to the long side, specify x as the short dimension and y as the long dimension. Conversely, if the user wants the values perpendicular to the short side, specify y as the short dimension, x as the long dimension. All distances are from the center of the basin. Users can change the distances from the center of the basin at which water-table aquifer thickness are calculated.

Cells highlighted in yellow are values that can be changed by the user. Cells highlighted in red are output values based on user-specified inputs. **The user MUST click the blue "Re-Calculate Now" button each time ANY of the user-specified inputs are changed** otherwise necessary iterations to converge on the correct solution will not be done and values shown will be incorrect. Use consistent units for all input values (for example, feet and days)

**YIELD AND QUALITY OF GROUND WATER FROM STRATIFIED-DRIFT AQUIFERS,
TAUNTON RIVER BASIN, MASSACHUSETTS: EXECUTIVE SUMMARY**

By Wayne W. Lapham and Julio C. Olimpio

U.S. GEOLOGICAL SURVEY

Water-Resources Investigations Report 86-4053A

Prepared in cooperation with

COMMONWEALTH OF MASSACHUSETTS
DEPARTMENT OF ENVIRONMENTAL MANAGEMENT
DIVISION OF WATER RESOURCES

Boston, Massachusetts
1989

PHYSICAL SETTING AND HYDROGEOLOGY OF THE BASIN

The Taunton River basin covers 530 mi² (square miles) of Bristol, Norfolk, and Plymouth Counties in southeastern Massachusetts. All or parts of the cities of Attleboro, Brockton, Fall River, New Bedford, and Taunton, and 36 towns are in the basin (fig. 1). The basin is drained by the Matfield, Town, and Taunton Rivers.

Tributary streams include the Canoe, Nemas-ket, Wading, Threemile, and Winnetuxet Rivers. Surface-water drainage is generally southward toward Mount Hope Bay, a part of Narragansett Bay at Fall River.

Stratified-drift deposits cover about 62 percent of the basin. These deposits are primarily ice-contact, outwash, and lake-bottom sediments, which were deposited in preglacial bedrock valleys and in water-filled depressions in the till and bedrock surface during retreat of the last glacier. The sediments are composed of sand, gravel, cobbles, silt, and clay. The drift ranges in thickness from zero to about 200 ft (feet) in some of the deep preglacial bedrock valleys. The thickest deposits are lake-bottom deposits composed of fine sand interbedded with silt and clay. Stratified-drift deposits are more abundant in the central and southern parts of the basin than in the northern part of the basin. In the northern one-third of the basin, stratified drift fills narrow, north-south trending valleys, which are bordered by till and bedrock uplands.

Yields of wells in the fine-grained stratified-drift deposits are usually no more than a few gallons per minute (gal/min) whereas yields of wells in the coarse-grained stratified drift may exceed 300 gal/min. The coarse-grained parts of the stratified-drift deposits form the major aquifers in the basin. In the northern part of the basin, these aquifers are long, narrow, and thin, and have saturated thicknesses that range from about 20 ft to somewhat more than 100 ft. The widths of the stratified-drift aquifers generally range from 0.1 to 1.5 mi (miles), and their lengths generally range from 1 to 5 mi.

Twenty-six stratified-drift aquifers in the northern half of the basin were studied in detail (fig. 2). These aquifers were selected because current and projected 1990 water-supply deficits are greatest in the northern half of the basin, affecting 14 of 19 municipalities. In contrast, only one of nine municipalities in the southern half of the basin is projected to have a deficit (Richard Thibedeau, Massachusetts Division of Water Resources, written

commun.,1984). The 26 aquifers also were selected because the use of ground water as the sole source of supply is greatest in the northern half of the basin. Fifteen of 19 municipalities in the northern half of the basin use ground water as compared to 4 of 9 municipalities in the southern half of the basin.

The 26 stratified-drift aquifers were identified as areas of stratified drift that have a transmissivity equal to or greater than 1,337 ft²/d (square feet per day), which is equivalent to 10,000 gallons per day per foot. The aquifers underlie or are near major rivers or tributaries. The aquifers are composed mostly of layers of sand and gravel but include some interbedded layers of silt and clay. John R. Williams (U.S. Geological Survey, written commun., 1982) determined that the hydraulic conductivity of fine-to-coarse gravel ranges from about 150 to 500 ft/d (feet per day), mixed sand and gravel averages about 200 ft/d, and fine-to-coarse sand ranges from about 25 to 150 ft/d. The transmissivity of the stratified drift is equal to the product of its hydraulic conductivity and saturated thickness. Therefore, equal transmissivities at different locations in an aquifer may be the result of thin deposits of high-conductivity drift or thick deposits of low-conductivity drift. Transmissivity exceeds 4,000 ft²/d in small areas in nearly all 26 aquifers. In a few areas, where the stratified drift is thick or has a high hydraulic conductivity, transmissivity exceeds 10,000 ft²/d.

AQUIFER YIELDS

Estimates from Model Simulations

During severe drought, ground-water discharge from aquifers to streams is reduced or ceases, streamflow is at a minimum, and only small amounts of surface water are stored in wetlands and ponds. Consequently, water pumped from most aquifers in New England during severe drought is derived largely from storage in the aquifers. During normal climatic conditions, water pumped from an aquifer is derived from storage, intercepted ground-water discharge, and induced infiltration of surface water. To account for drought and normal conditions, two sets of aquifer-yield estimates were made for each of the 26 stratified-drift aquifers using simple ground-water flow models. "Short-term" aquifer yields during drought conditions were determined by considering only water from storage and are expressed as single values for several selected pumping periods. "Long-term" aquifer yields during normal

HYDROLOGIC PROPERTIES OF EARTH MATERIALS

SPECIFIC YIELD—COMPILATION OF SPECIFIC YIELDS FOR VARIOUS MATERIALS

By A. I. JOHNSON

ABSTRACT

Specific yield is defined as the ratio of (1) the volume of water that a saturated rock or soil will yield by gravity to (2) the total volume of the rock or soil. Specific yield is usually expressed as a percentage. The value is not definitive, because the quantity of water that will drain by gravity depends on variables such as duration of drainage, temperature, mineral composition of the water, and various physical characteristics of the rock or soil under consideration. Values of specific yield, nevertheless, offer a convenient means by which hydrologists can estimate the water-yielding capacities of earth materials and, as such, are very useful in hydrologic studies.

The present report consists mostly of direct or modified quotations from many selected reports that present and evaluate methods for determining specific yield, limitations of those methods, and results of the determinations made on a wide variety of rock and soil materials. Although no particular values are recommended in this report, a table summarizes values of specific yield, and their averages, determined for 10 rock textures. The following is an abstract of the table:

Specific yields, in percent, of various materials

[Rounded to nearest whole percent]

Material	Number of determinations	Specific yield		
		Maximum	Minimum	Average
Clay.....	15	5	0	2
Silt.....	16	19	3	8
Sandy clay.....	12	12	3	7
Fine sand.....	17	28	10	21
Medium sand.....	17	32	15	26
Coarse sand.....	17	35	20	27
Gravelly sand.....	15	35	20	25
Fine gravel.....	17	35	21	25
Medium gravel.....	14	26	13	23
Coarse gravel.....	14	26	12	22

INTRODUCTION

PURPOSE AND SCOPE

The purpose of this report is to assist hydrologists in estimating the quantity of water in storage in ground-water reservoirs by providing

BEALS + THOMAS

Standard 3: Drawdown

$$\text{Drawdown Time} = \frac{R_v}{(K) (\text{Bottom Area})}$$

where:

Rv = Storage Volume Below Outlet [Ac-ft]

K= Infiltration Rate [in/hr]

Bottom Area= Bottom Area of Recharge System [Ac]

Infiltration Bed 1

Rv = 0.022 Ac-ft

K = 2.410 in/hr

Bottom Area = 0.056 Acres

Drawdown Time = 1.956 Hours

< 72 Hours, Design is in compliance with the standard.

Infiltration Bed 5

Rv = 0.021 Ac-ft

K = 2.410 in/hr

Bottom Area = 0.053 Acres

Drawdown Time = 1.973 Hours

< 72 Hours, Design is in compliance with the standard.

Note:

1. The infiltration BMPs have been designed to fully drain within 72 hours, therefore the proposed stormwater management design is in compliance with Standard 3 .

2. Infiltration Rate based on Volume 3, Chapter 1, Table 2.3.3 *Rawls Rates* from the 2008 MA DEP Stormwater Management Handbook.

Southborough, MA 01772-2104

Addendum Issued: April 7, 2021

Stormwater Management System Components

The following table outlines the type and quantity of the BMPs and their general location. Please reference the site plan(s) provided in the Figures section for exact location.

BMP Type	Quantity	Location
Infiltration Bed	5	Throughout the site at equipment pads.

Estimated Operation and Maintenance Budget

An operations and maintenance budget was prepared to approximate the annual cost of the inspections required in compliance with the DEP Stormwater Management Policy. The table below estimates the annual cost to inspect and maintain each proposed BMP, based on the requirements in Section 4.2.

BMP Type	# of BMPS	Annual O&M Cost (per BMP)¹	Total Cost
Infiltration Bed	5	\$200-\$400	\$1000-\$2000
Total			\$1000-\$2000

¹ Annual maintenance cost is based on estimate of the cost to complete all inspection and maintenance measures outlined in Section 4.2. For BMPs that require sediment removal at regular intervals (i.e. every 5 or 10 years), the annual cost includes the annual percentage of that cost.
