Storm Water Management-CEDA

The storm water management system selected is best suited to the site and provides the least disturbance of the site while recharging the aquifer. The system is sized to mitigate the effects of increased runoff typically resulting from development of a site. The storm water management system consists of the collection of overland runoff to an infiltration basin on site. The drainage system is designed to offset increased storm flows and provide water quality in accordance with the regulations of both state and local authorities. This drainage system is intended to mitigate increased runoff generated from new construction so the downstream wetlands, water bodies, and neighboring homes will not be impacted. The drainage system will completely control post development peak flows and provide for total suspended solids (TSS) removal at the maximum possible rate.

The Pre-Development watershed area (PRE) encompasses 11.28 acres, which includes portions of the existing development on the west side of Bay Pointe Drive.

Under Post Development Conditions, the site has been divided into seven sub-watershed areas containing a total of 11.07 acres, labeled “POST BASIN”, “POST EAST”, “POST CENTER”, “POST WEST”, “POST PARKING”, POST BPD” and “POST UNC”.

The following table summarizes the results of the inflow analysis for the seven sub-watershed areas under post development conditions:

WATERSHED	2-YEAR STORM	10-YEAR STORM	25-YEAR STORM	100-YEAR STORM
POST BASIN	0.01 CFS	0.22 CFS	0.71 CFS	1.96 CFS
POST EAST	0.59 CFS	1.16 CFS	1.59 CFS	2.30 CFS
POST CENTER	0.76 CFS	1.30 CFS	1.68 CFS	2.29 CFS
POST WEST	2.95 CFS	5.45 CFS	7.30 CFS	10.28 CFS
POST PARK	1.26 CFS	2.99 CFS	4.38 CFS	6.74 CFS
POST BPD	1.28 CFS	2.92 CFS	4.23 CFS	6.44 CFS
POST UNC	-0- CFS	0.03 CFS	0.10 CFS	0.27 CFS

Stormwater Calculations – CEDA
Bay Pointe Club Mixed-Use Development Project
Wareham, MA
August 27, 2021

The following table compares the flows between pre-development conditions and post development conditions, after flows are routed through the infiltration basin:

WATERSHED	2-YEAR STORM	10-YEAR STORM	25-YEAR STORM	100-YEAR STORM
PRE	0.29 CFS	1.78 CFS	3.50 CFS	6.97 CFS
POST	-0- CFS	0.03 CFS	0.10 CFS	6.25 CFS
DIFFERENCE	-0.29 CFS	-1.75 CFS	-3.40 CFS	-0.72 CFS

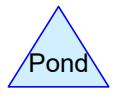

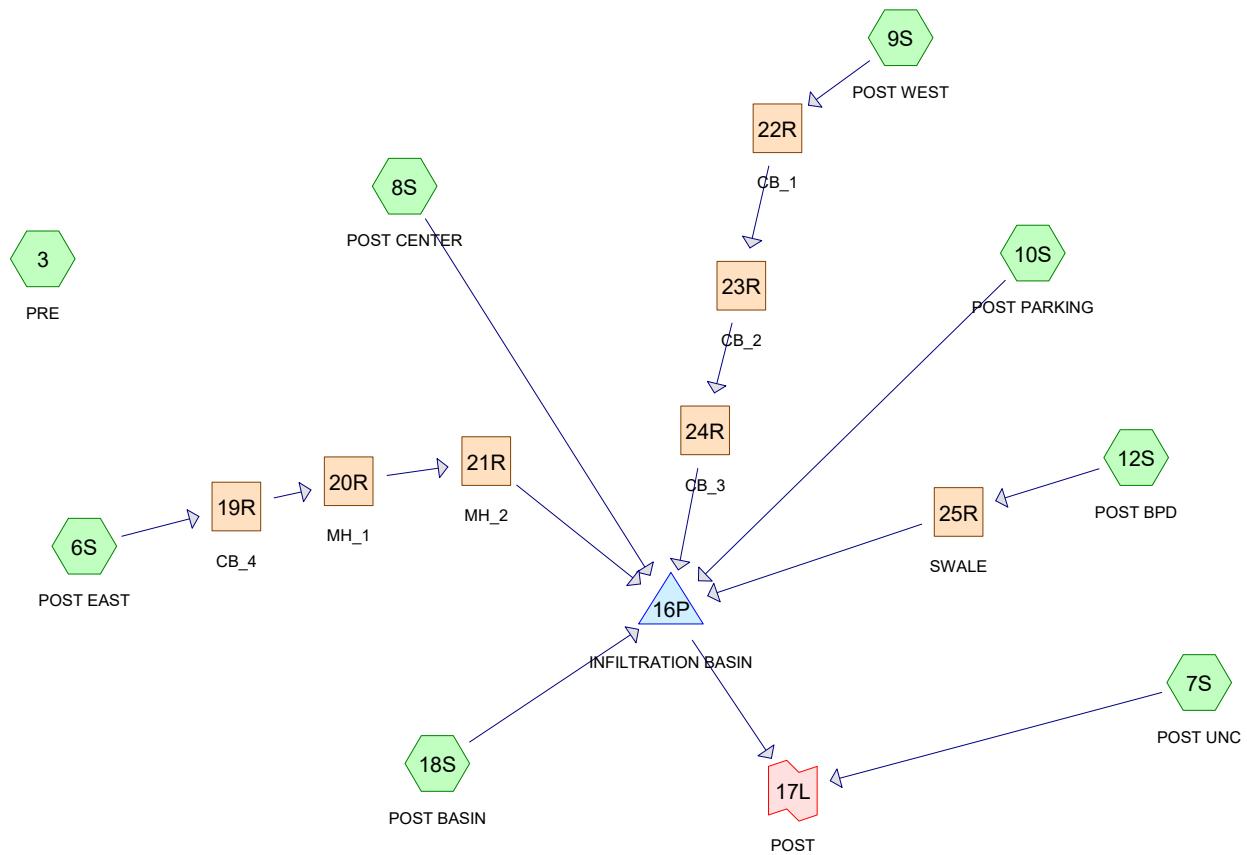

The drainage collection system proposed takes full advantage of the natural slopes and contours of the site and utilize the existing course sandy subsoil parent material. It provides for both peak storm flow mitigation and sediment removal. By reducing post-development storm water flows, the primary goal of the proposed drainage system is achieved. Any potential impacts from the proposed development on the abutting properties have been mitigated.
